WARNING – INFORMATION SUBJECT TO EXPORT CONTROL RESTRICTIONS

This document contains technology controlled for export by the U.S. Department of Commerce in accordance with Export Administration Regulations (EAR). Diversion contrary to U.S. law prohibited. Include this notice with any reproduced portion of this document.

#### **Export Compliance:**

This product is controlled by the export laws and regulations of the United States of America. The U.S. Government may restrict the export or re-export of this product to certain individuals and/or destinations. For further information, contact the U.S. Department of Commerce, Bureau of Industry and Security.

This product User shall comply with all applicable laws related to export and import of this product in any jurisdiction and/or government authority. User shall be responsible for complying with any and all export and import restrictions, laws and regulations in any country User is conducting business.

#### Disclaimer:

This manual contains information that is current as of the date shown on the front cover. Every effort has been made to ensure the correctness and completeness of the material in this document. The information in this document is subject to change without notice. Thales<sup>®</sup>, Thales MissionLINK<sup>®</sup>, and any other Thales trademark or Thales service mark referred to or displayed in this document are trademarks or registered trademarks of Thales.

#### Legal Notices

This product is subject to a Limited Warranty, Limitations, Exclusions, and Terms and Conditions, which can be found on line at <u>www.thalesdsi.com</u>.

Prior to Installing this product, read and understand this Installation Guide and the User Manual, including the safety warnings and information. Failure to do so could result in serious injury or death.

#### **Intellectual Property**

User acknowledges that the Products involve valuable patent, copyright, trademark, trade secret and other proprietary rights of Thales and others. No title to or ownership of any proprietary rights related to any Product is transferred to User or any Customer pursuant to the use of this product. The purchase of any Thales products shall not be deemed to grant either directly or by implication or otherwise, any license under copyrights, patents, or patent applications of Thales or any third party software providers, except for the normal, nonexclusive, royalty free license to use that arises by operation of law in the sale of a product.

#### **Content Copyright**

User is exclusively responsible for the use of this product, including proper use of third party copyrighted materials. If the User violates these terms, the User agrees to defend, indemnify and hold Thales harmless with respect to any claims or actions by third parties related to the improper use of copyrighted material and to pay all costs, damages, fines and other amounts incurred by Thales, or on its behalf, in the defense of any such claims or actions.

#### Indemnity

User agrees to defend, indemnify and hold Thales harmless with respect to any claims or actions by any governmental entities or other third parties related to any violation of law with use of the Product or Accessories, misuse of the Product or Accessories under these Terms and Conditions, or any other violation of these Terms and Conditions and further agrees to pay all costs, damages, fines and other amounts incurred by Thales, or on Thales's behalf, in the defense of any such claims or actions.

#### SOFTWARE LICENSE

The following terms govern User's access and use of the Thales-supplied software ("Software") contained on the Product or Accessories.

License. Conditioned upon compliance with these Terms and Conditions, Thales grants to USER a nonexclusive and nontransferable license to use for USER's internal purposes the Software and the Documentation. "Documentation" means any written information pertaining to the Software and made available by Thales with the Software in any manner. USER shall use the Software solely as embedded for operation of this product.

No other licenses are granted by implication, estoppel or otherwise.

#### Thales Product Warranty Claim Process

Please see the Thales website at www.thalesdsi.com.

#### **User Documentation:**

Thales Defense & Security, Inc. continually evaluates its user documentation for accuracy and completeness. Any suggestions you may have for changes or additions should be sent to <u>THALES ILS@thalesdsi.com</u> Subject Line: Thales MissionLINK<sup>®</sup> User Manual (PN 84468/84468-IETM).

### SAFETY

The Thales MissionLINK<sup>®</sup> system should only be installed by a qualified installer of Land Mobile electronic systems. Improper installation could lead to system failure or could result in injury. The following are general safety precautions and warnings that all personnel must read and understand prior to installation, operation and maintenance of the Thales MissionLINK<sup>®</sup> system. Each chapter may have other specific warnings and cautions.

#### SHOCK HAZARD

The MissionLINK<sup>®</sup> system is a sealed system and is not meant to be opened for repair in the field by operators or technicians. Covers must remain in place at all times on the Terminal Unit (TU) and Broadband Active Antenna (BAA) to maintain the warranty terms. Make sure the system is correctly grounded and power is off when installing, configuring and connecting components.

### **DO NOT OPERATE IN AN EXPLOSIVE ATMOSPHERE**

This equipment is not designed to be operated in explosive environments or in the presence of combustible fumes. Operating this or any electrical equipment in such an environment represents an extreme safety hazard.

#### **LITHIUM ION BATTERIES**

The TU contains a small Li-ion battery. Li-ion batteries have a very high energy density. Exercise precaution when handling and testing. Do not short circuit, overcharge, crush, mutilate, nail penetrate, apply reverse polarity, expose to high temperature or disassemble. High case temperature resulting from abuse of the cell could cause physical injury.

### **ANTENNA RADIATION HAZARDS**

To comply with FCC Radio Frequency radiation exposure limits, the MissionLINK antennas must be installed at a minimum safe distance as shown below.

During operation, the antenna radiates high power at microwave frequencies that can be harmful to individuals. While the unit is operating, personnel should maintain a minimum safe distance from the antenna. The antenna should be mounted in an area that prevents the possibility of close exposure to the antenna's radiation.

For the Certus 350 antenna, please remain at least 1.0m (3.3 feet) from the antenna while in operation.

For the Certus 200 antenna, please remain at least 0.8m (31 inches) from the antenna while in operation.

Este Equipamento não tem direito à proteção contra interferencia prejudicial e não pode causar interferência em Sistemas devidamente autorizados

### **FCC** Information

Certus 350 FCC Identifier: OKCMF350BV Contains FCC ID: OKCWROOM32U

Certus 200FCC Identifier: OKCMF200BV Contains FCC ID: OKCWROOM32U

Changes or modifications not expressly approved by the manufacturer could void the user's authority to operate the equipment.

### Note:

This equipment has been tested and found to comply with the limits for a <u>Class B digital device</u>, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against <u>harmful interference</u> in a residential installation. This equipment generates, uses and can radiate <u>radio frequency energy</u> and, if not installed and used in accordance with the instructions, may cause <u>harmful interference</u> to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause <u>harmful interference</u> to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment to a source on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

### Industry Canada Information

Certus 350 Industry Canada: 473C-MF350BV Contains IC: 473C-WROOM32U

Certus 200 Industry Canada: 473C-MF200BV Contains IC: 473C-WROOM32U

Under Industry Canada regulations, this radio transmitter may only operate using an antenna of a type and maximum (or lesser) gain approved for the transmitter by Industry Canada. To reduce potential radio interference to other users, the antenna type and its gain should be so chosen that the equivalent isotropically radiated power (e.i.r.p.) is not more than that necessary for successful communication.

Conformément à la réglementation d'Industrie Canada, le présent émetteur radio peut fonctionner avec une antenne d'un type et d'un gain maximal (ou inférieur) approuvé pour l'émetteur par Industrie Canada. Dans le but de réduire les risques de brouillage radioélectrique à l'intention des autres utilisateurs, il faut choisir le type d'antenne et son gain de sorte que la puissance isotrope rayonnée équivalente (p.i.r.e.) ne dépasse pas l'intensité nécessaire à l'établissement d'une communication satisfaisante.

This radio transmitter (473C-MF350BV or473C-MF200BV) has been approved by Industry Canada to operate with the antenna listed in Table 7-1 with the maximum permissible gain and required antenna impedance for each antenna type indicated. Antenna types not included in this list, having a gain greater than the maximum gain indicated for that type, are strictly prohibited for use with this device.

Le présent émetteur radio (473C-MF350BV ou 473C-MF200BV) a été approuvé par Industrie Canada pour fonctionner avec les types d'antenne énumérés ci-dessous et ayant un gain admissible maximal et l'impédance requise pour chaque type d'antenne. Les types d'antenne non inclus dans cette liste, ou dont le gain est supérieur au gain maximal indiqué, sont strictement interdits pour l'exploitation de l'émetteur.

This device complies with Industry Canada license-exempt RSS standard(s). Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes: (1) l'appareil ne doit pas produire de brouillage, et (2) l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

# **Z571 Limited**

## **Statement of Compliance**

### Document No. 11633\_NZ

Based on documentation provided by the manufacturer Thales Communication Inc. the product listed below complies with the requirements of the **General User Radio Licence for Satellite Services** dated 21 April 2015.

Low (MHz)	High (MHz)	Reference Frequency (MHz)
399.9	400.5	400.2
1610	1660.5	1635.25
14000	14500	14250

Trade Name Model Number Description Thales; Thales MissionLINK MF350BV Broadband Certus Satellite Terminal and Antenna

Gordon Slimmon Director Date: 21 September 2018

> Z571 Limited (NZCN 1628242) Registered Office C/- Hohepa Chartered Accountants Limited, 45 Spinnaker Drive, Te Atatu Peninsula, Auckland, New Zealand CF11633

### THALES DEFENSE & SECURITY, INC.

### **Declaration of Conformity with Radio Equipment Directive**

The undersigned of this letter declares that the following equipment complies with the specifications of Radio Equipment Directive (2014/53/EU) concerning Radio & Telecommunications Equipment.

#### Equipment included in thisdeclaration

VF350BM Certus 350 VesseLINK Broadband Maritime Satellite Terminal and Antenna

VF200BM Certus 200 VesseLINK Broadband Maritime Satellite Terminal and Antenna

MF350BV Certus 350 MissionLINK Broadband Maritime Satellite Terminal and Antenna

MF200BV Certus 200 MissionLINK Broadband Maritime Satellite Terminal and Antenna

#### **Equipment Applicability**

The VesseLINK and MissionLINK provide voice and high speed data communication over 100% of the globe through the Iridium Certus broadband Satellite system.

#### Declaration

The health requirement is met by conforming to EU standard EN 623 11. The safety requirement is met by conforming to EN 60950-1:2006 w/A2:2013 (for Certus 350) and to EN 62368-1:2014 (for Certus 200). The electromagnetic compatibility as set out in Directive 2014/30/EU is met by conforming to the EU standards ETSI EN 301-489-1 and ETSI EN 301-489-17. Effective and efficient use of radio spectrum in order to avoid harmful interference is met by conforming to the ETSI EN 301-441 standard.

### CHAPTER 1 INTRODUCTION

#### **INTRODUCTION**

Thank you for your recent purchase of a Thales MissionLINK<sup>®</sup> product. Powered by the Iridium global satellite network, it is the only system with truly pole-to-pole coverage for voice and data communications. This USER MANUAL will cover a basic overview as well as advanced features for the Thales MissionLINK<sup>®</sup> systems including the Certus 350 MissionLINK and the Certus 200 MissionLINK.

Additional information can be found in the following documents:

- The Thales MissionLINK installation process is covered in the Installation Guide for the MissionLINK (Document # 84465)
- The Thales MissionLINK Quick Start Guide (QSG) (Document # 3402174-1)

Some figures in this manual depict a representative antenna that may be either a Certus 350 antenna or a Certus 200 antenna. Functionally, either antenna can be used for the operation described in the figures.

### **ABOUT THIS MANUAL**

This user manual is intended for anyone who intends to operate and configure the MissionLINK system. It covers both the Certus 350 and the Certus 200 system operation and features. It, however, cannot cover all topics and advanced features. For questions or topics that are not covered in this manual, please contact your service provider or Thales at <u>www.Thalesdsi.com</u>.

### THE IRIDIUM SATELLITE NETWORK

The Iridium satellite network is comprised of 66 Low-Earth Orbiting (LEO), cross-linked satellites, providing voice and data coverage over Earth's entire surface. The satellites operate in six orbital planes, 781 kilometers (485 miles) from Earth.

This ensures that every region on the globe is covered by at least one satellite at all times. Each satellite is cross-linked to four other satellites; two satellites in the same orbital plane and two in an adjacent plane.

The Iridium NEXT satellite constellation replaced the legacy Iridium satellite constellation with faster data rates, more capacity and better voice quality.

Figure 1-1 Earth showing Iridium satellites in six defined orbital planes.

Figure 1-2 shows a typical flow over the Iridium network of a call made from the MissionLINK system.

A MissionLINK voice or data call is sent to the closest satellite overhead that has a high signal strength. The traffic is then routed through the satellite network to a Ground Station or Gateway. At the gateway, traffic is converted back to internet protocol (IP) and voice, depending on call type and delivered to the IP cloud or the public switched telephone network (PSTN).

Figure 1-2 Typical Iridium Network Flow of a Voice or Data Call.

### CHAPTER 2 SYSTEM OVERVIEW

#### SYSTEM DESCRIPTION

The MissionLINK system operates using Iridium Certus<sup>™</sup> broadband services over a network of 66 satellites that cover 100% of the globe, including remote locations and the poles. The solution utilizes this robust network service to provide highly reliable, mobile and essential voice, text and web communications. For best operation, a clear view of the sky is necessary as satellites can be as low as eight degrees above the horizon. The service capabilities of the system are outlined below.

Certus<sup>™</sup> Multi-Services Platform

- Satellite data sessions up to 352kbps uplink and 704kbps downlink for Certus 350 systems and 176kbps uplink and 176kbps downlink for Certus 200 systems
- Up to 3 high quality Iridium voice lines

### **Satellite Voice**

Figure 2-1 Calling Overview for Three Voice Lines

Primary System Features (for both Certus 350 and Certus 200 systems)

- Embedded 802.11b/g/n Wi-Fi access point with up to three (3) simultaneous users.
- Intuitive Management Portal user interface for configuration, monitoring and system status.
- Application Programming Interface (API) for local and remote management and issue resolution.
- Private Branch Exchange (PBX) functionality provides extensions for free local calling through the terminal. (Figure 2-2).
- Least Cost Routing automatically routes the data to an optional, lower cost network (i.e., cellular, Wi-Fi, etc.).
- Secondary Data Flows (SDF) maps specialized data services to physical ports
- GNSS capability allows configuration of multiple satellite constellations including GPS, GLONASS, Galileo and Beidou for precise autonomous geo-spatial positioning
- Low profile, IP66/IP67 (Certus 350/Certus200) rated antenna with single RF cable to the Terminal Unit (TU).
- Magnetic mount kit for easy antenna installation.
- Radio Gateway feature enables Land Mobile radios to access the satellite voice network.
- Ruggedized tethered Thales SureLINK IP Handset provides reliable, remote system configuration, monitoring and voice calls (optional).
- Supported WEB Browsers:
  - Chrome
  - o Safari
  - Firefox
  - o Android
  - o iOS (Safari)

Microsoft WEB Browsers are not supported.

Figure 2-2 Local Communications via PBX Functionality

A typical user setup that includes standard kit items, accessories and user provided items such as a POTS phone, VoIP phones and a computer is shown in Figure 2-3. A cellular modem or other network modem can be connected to the WAN port for data least-cost routing operations. Voice calls are always routed through the Iridium satellite system and not the WAN port.

Figure 2-3 MissionLINK System with Connected Hardware

### **Terminal Unit (TU)**

The Terminal Unit (TU) supports voice and data communications in a land mobile or terrestrial fixed environment. The TU is capable of supporting wireless voice and data that links the user with the Iridium satellite network. The TU, depending on Line of Site (LOS) and LEO Satellites, will be able to maintain satellite connectivity while experiencing conditions varying from urban canyons to high vibration from road movement. As a wireless access point, the TU provides Wi-Fi (802.11) access for data and Voice over IP (VoIP) calls. Three RJ-45 Ethernet connectors and one RJ14 connector enables the user to tether directly to the TU, if desired. The Management Portal is a graphical user interface that can be used to modify system settings and indicate system status. The TU is powered by either a DC power cable with a 10-32V input range and remote start wire or an AC/DC power supply, accommodating all types of vehicles, applications and power sources.

Figure 2-4 Terminal Unit (TU)

The Terminal Unit has three status LEDs on the top of the unit that indicate status of system power-up, satellite connection and the Wi-Fi.

Figure 2-5 Terminal Unit (TU) LEDs

Indicator	Description	
ථ System		
Solid GREEN	System functioning properly	
Flashing GREEN	System busy (Booting up)	
Solid YELLOW	Warning (functioning but minor issue)	
Solid RED	Fault (minor issue)	
Flashing RED	Critical fault (major issue)	
Solid MAGENTA	Defective System	
Satellite		
Solid BLUE	Connected and passing data (over satellite)	
Solid GREEN	System functioning properly	
Flashing GREEN	Acquiring satellite	
Solid RED	Fault (minor issue)	
Flashing RED	Critical fault (major issue)	
<b>Wi-Fi</b>		
OFF	Wi-Fi OFF	
Flashing GREEN	Wi-Fi busy	
Solid Green	System functioning properly	
Solid RED	Fault (minor issue)	
Flashing RED	Critical fault (major issue)	

Table 2-1 Terminal Unit LED Status

The Indicator Colors are:

Solid Green: Operational

<u>Flashing Green</u>: Start-up or in progress of configuring or acquiring service

<u>Solid Yellow</u>: System is operational but a minor issue should be addressed

<u>Solid Red</u>: Fault requires user attention (Open Management Portal for Alerts)

<u>Flashing Red</u>: Critical fault requiring immediate attention. For additional information, refer to Chapter 6 Troubleshooting <u>Solid Magenta</u>: Defective system. For additional information, refer to Chapter 6 Troubleshooting.

The Terminal Unit front panel (left to right) has a main power button, one RJ-14 connector for POTS (Plain Old Telephone Service) Phone(s), three PoE (Power over Ethernet) RJ-45 connectors for VoIP phones or Ethernet-based devices, and one WAN (Wide Area Network) connector primarily used to connect an external cellular modem or VSAT.

Figure 2-6 Terminal Unit (TU) Front Panel Detail

The Terminal Unit back panel (left to right) has a Wi-Fi antenna connector, reset button, SIM Card slot, GPIO (I/O) connector, 10-32Volt DC input connector, 12Volt DC power input, antenna connector, and chassis grounding lug.

Figure 2-7 Terminal Unit (TU) Back Panel Detail

### **Broadband Active Antenna (BAA)**

The BAA is a separate unit that connects to the Terminal Unit through a single coaxial cable. DC power, RF transmit and receive signals, control data and GPS data are communicated between the BAA and Terminal Unit through the single coaxial cable.

Figure 2-8 Broadband Active Antenna (BAA) Unit for Certus 350 and Certus 200 Systems

### **RF COAXIAL CABLE INSTALLATION CONSIDERATIONS**

Good quality RF coaxial cable is recommended. Several considerations must be taken into account concerning the cable when installing a MissionLINK system. These include:

- **RF Cable loss** The MissionLINK system is designed to operate with an RF cable loss of 10 dB or less in the L-band frequency of operation (1616-1626 MHz). Thales accessory cables listed below have been selected to meet this criteria.
- **DC losses due to cable resistance (inner conductor and shield)** The MissionLINK system is designed to work with a maximum total RF cable ohmic resistance of 1.10 Ohms round-trip (inner conductor and shield). Thales accessory cables listed below meet this criteria.
- **Cable length** The maximum cable length that the MissionLINK can operate with is 50 meters due to the delay requirements of the system. The maximum Thales cable length accessory cable is 50 meters in length.

Cable	TDSI Part Number	
10 foot TWS-240	855021-010	
20 foot TWS-240	855021-020	
30 foot TWS-250	855021-030	
50 foot TWS-240	855021-050	
100 foot TWS-240	855022-100	
25 meters LMR-300 FR	855023-082	
50 meters LMR-400 FR	855033-164	

1	able	2-2	Coaxial	Cable	List

The last two cables are Fire Rated (FR) providing resistance to fire and continued operation in the presence of fire, improving safety when being used.

### CHAPTER 3 GETTING STARTED

#### **GETTING STARTED**

# **STEP 1: Connect Phone (standard POTS handset) or Ethernet VoIP Phone to Terminal Unit (TU).**

The TU front has a main power button, one RJ-14 connector for POTS (Plain Old Telephone Service), three PoE (Power over Ethernet) RJ-45 connectors for VoIP phones or Computers, and one WAN (Wide Area Network) connector. Refer to Figure 3-1 for location of the connectors.

Figure 3-1 Terminal Unit (TU) Front Panel Detail

#### POTS Phone connection

By default, the POTS Phone(s) are pre-configured to use the first two Iridium voice lines without any additional configuration.

The TU can accept up to two (2) POTS Phones connected with a RJ-14 Splitter (not provided). Using a RJ-14 Splitter, the two POTS phones can each have a separate phone line (not two phones using the same phone line). Note that single, molded plastic piece RJ-14 Splitters (triplex jacks) will not fit into the POTS phone connector. It is recommended that a POTS Splitter be used that includes a short phone cord that fits into the TU POTS connector.

#### VoIP or Thales SureLINK IP Phone connection

By default the TU has three (3) extensions preconfigured for use with POTS phones, VoIP phones, or Thales SureLINK IP Handsets, as shown in Table 3-1.

If using a VoIP phone, Thales recommends CISCO SPA504G and Grand Stream GXP2140 models for use with Thales MissionLINK. Other brands and models may work but have not been tested by Thales.

Follow your VoIP phone configuration guide to setup the VoIP phone and connect to the TU using the following parameters. For detailed VoIP phone setup see Chapter 4, VoIP Phone Settings.

Extension 1: (will make and receive calls	User: "1001"
on line 1 of your SIM)	Password: "1001"
	Host: "sip.thaleslink"
	Protocol: udp
Extension 2:(will make and receive calls	User: "1002"
on line 2 of your SIM)	Password: "1002"
	Host: "sip.thaleslink"
	Protocol: udp
Extension 3:(will make and receive calls	User: "1003"
on line 3 of your SIM)	Password: "1003"
	Host: "sip.thaleslink"
	Protocol: udp

Table 3-1 Typical VoIP Phone Configuration

By default, extensions 1 and 2 are mapped to POTS phone connections and Extension 3 is flexible. A VoIP phone can be configured to any extension even those assigned to the POTS lines. The SureLINK IP Handset will have a default of 1002 or extension 2, so it will automatically work the same as the first POTS line.

### **STEP 2: Know your MissionLINK**

It may be necessary to know details about your MissionLINK system when calling for help or service.

<u>IMEI</u> is unique to each unit and can be found on the back plate of the TU. This IMEI can also be found in the http://portal.thaleslink (or https://portal.thaleslink)\_under the ABOUT tab.

<u>IMSI</u> is a unique identifier to each SIM card. This IMSI can also be found in the http://portal.thaleslink (or https://portal.thaleslink)under the STATUS  $\rightarrow$  SIM tabs. (SIM must be inserted).

Using https:// allows for secure connections between the TU and the computer viewing the Thales Management Portal.

pon ک	al.thaleslink			portal.thales	link (

Figure 3-2 MissionLINK IMEI and IMSI from Mobile Device

### **STEP 3: Install SIM**

1. Open the SIM Card protective cover by pulling it away from the TU, exposing the SIM card slot. (Figure 3-3).

Figure 3-3 SIM Card with Cover Opened

- 2. Install SIM card from Air-time provider (1, Figure 3-4), by inserting the card with contacts down (2) until it clicks into place (3).
- 3. Be sure to engage the lock for the SIM Card (4).

Figure 3-4 Installing SIM Card and Engaging the Lock

4. Secure the SIM Card cover once the SIM Card has been locked into place to prevent moisture or dust intrusion. (Figure 3-5)

Figure 3-5 Secure the SIM Card Cover

### STEP 4: Power the MissionLINK unit.

Before powering the unit, make sure the DC power cable is connected to a 10-32VDC source, the polarity is correct, and the DC cable is securely connected to the TU. If using the AC/DC power supply, connect one end to the terminal's 12V DC input and connect the power cord to a 120 or 240V AC outlet. The antenna must also be connected per the corresponding system installation manual. Power the unit by pressing and releasing the power button on the TU (Figure 3-1). NOTE: After the button is pressed and released, a few seconds pass before the System LED (left) starts flashing. It may take a few minutes on initial startup for all three LED's on the unit top to turn solid **GREEN** (middle LED may turn **BLUE**). You may see an occasional red LED during power up. This is normal. Refer to Table 3-2 for more information on the status LEDs.

Figure 3-6 System, Satellite and Wi-Fi Status LEDs

Indicator Description	
じ System	
Solid GREEN	System functioning properly
Flashing GREEN	System busy (Booting up)
Solid YELLOW	Warning (functioning but minor issue)
Solid RED	Fault (minor issue)
Flashing RED	Critical fault (major issue)
Solid MAGENTA	Defective System

Solid RED	Fault (minor issue)
Flashing RED	Critical fault (major issue)
ᅙ Wi-Fi	
OFF	Wi-Fi OFF
Flashing GREEN	Wi-Fi busy
Solid Green	System functioning properly
Solid RED	Fault (minor issue)
Flashing RED	Critical fault (major issue)

Table 3-2 Terminal Unit LED Status	Table 3-	2 Terminal	Unit LED	Status
------------------------------------	----------	------------	----------	--------

#### STEP 5: Connect to MissionLINK portal to configure system.

Thales uses a self-signed certificate for encryption between the terminal and the browser when viewing the Management Portal (<u>https://portal.thaleslink</u>). A self-signed certificate is a security certificate that is not signed by a certificate authority (CA). As such, a user will experience a warning in their browser before the keys are exchanged. The warning is different between browser types. Thales recommends you accept the risk posed by the browser. The browser will use HTTPS without warning until the key is either deleted or expires.

Reference Figure 3-7. There are a couple options to login to the Management Portal.

#### Option A: Via Wi-Fi.

- 1. Power on the MissionLINK TU and let it boot up (may take a few minutes).
- 2. On the wireless device, find and select the SSID ThalesLINK as an available Wi-Fi access point. No password is required on initial setup and is left to the user to add WPA2 protection with a password during this configuration process.
- 3. Open a browser and type: http://portal.thaleslink (or https://portal.thaleslink) (do not type .com or any other extension)
- 4. As a default, no changes to setup are necessary, but advanced users may want to configure their preferred system settings.
- 5. Once the Management Portal opens, click LOGIN button. Enter "admin" for Login ID and Password.
- 6. At this time, it is advised that you change the Management Portal admin password. To change password: Go to SETTINGS →GENERAL and change the password for the "Admin" user. A strong password is required that is at least 8 characters with a lowercase letter, an uppercase letter, a number, and a special character.

Option B: Via (PC, Mac or Linux) Ethernet connection

- 1. With your computer, connect the Ethernet RJ-45 Cable (included) to any of the 3 Ethernet ports on the TU. (Shown on Figure 2-6) (Do not connect to the WAN port identified on the TU with a box around the port.)
- 2. Via the network settings on your computer's operating system, enable the MissionLINK connection.
- 3. Open a web browser and type: http://portal.thaleslink (or https://portal.thaleslink) (do not type .com or any other extension)
- 4. As a default, no changes to setup are necessary, but advanced users may want to configure their preferred system settings.
- 5. Once the Management Portal opens, click LOGIN button. Enter "admin" for the Login ID and Password.
- 6. At this time it is advised that you change the Management Portal admin password. To change password: Go to SETTINGS → GENERAL and change the password for the "Admin" User. A strong password is required that is at least 8 characters with a lowercase letter, an uppercase letter, a number, and a special character.

NOTE

If you forget the Wi-Fi WPA2 password or the admin password, press and hold the reset pin on the back of the box (while powered on) in order to reset the system to factory settings. All custom configuration settings will be lost.

	Thales Defense & Security, Inc. All Rights Reserved

Figure 3-7 MissionLINK User Interface Login

#### **STEP 6: Place a phone call.**

The MissionLINK system contains Private Branch Exchange (PBX) functionality, where both local calls and outside calls can be made. Local extensions can be dialed directly from another local phone, but outside calls require dialing a "9" in order to connect to an outside line prior to dialing the phone number (unless disabled from the Management Portal).

- 1. Choose either POTS or VoIP handset.
- 2. Lift the handset from the base and listen for a dial tone.
- 3. For all calls using the Iridium Voice Services, dial 9 before the phone number. When making a local call, simply dial the extension.
- 4. Call a known number to test call and voice clarity

### Call the Iridium automated message: (9) 1-480-752-5105

#### **STEP 7: Access the Internet.**

Once your device has successfully connected to the TU, open the Management Portal http://portal.thaleslink (or https://portal.thaleslink)\_to verify the satellite connection.

Verify:

- No active alerts (DASHBOARD or ALERTS page on the Management Portal).
- Satellites detected (go to STATUS → SERVICE), signal strength bars (top right of screen) should show more than 1 bar as available.
- Data is defaulted off from the factory. To enable data, login and click the "ACTIVATE" button by enable session on the Dashboard tab.
- Check that the antenna has a clear view of the sky or check the alerts if voice calls or data fail.

Try loading a small website such as <u>www.google.com</u> to verify your internet connection. If the page loads successfully you are ready to browse the internet.

### CHAPTER 4 THALES MANAGEMENT PORTAL

To access the Management Portal from a laptop:

- Power on the Thales MissionLINK TU and let it boot up (may take a few minutes)
- Open a web browser
- Type: http://portal.thaleslink (or https://portal.thaleslink) (do not type .com or any other extension)
- The Management Portal appears in "guest" mode.
- To make changes, log in as an administrator by selecting LOGIN at the top of the window
- When prompted, enter the default Username (admin) and Password (admin)
- Immediately change the Password for added security (SETTINGS→GENERAL). A strong password is required that is at least 8 characters with a lowercase letter, an uppercase letter, a number, and a special character.

To access the Management Portal from a wireless device using Wi-Fi:

- Power on the MissionLINK TU and let it boot up (may take a few minutes)
- On the wireless device, find and select ThalesLINK as an available Wi-Fi access point.
- Open a browser and type: http://portal.thaleslink (or https://portal.thaleslink) (do not type .com or any other extension)
- The Management Portal appears in "guest" mode.
- To make any changes, log in as an administrator by selecting LOGIN at the top of the window
- When prompted, enter the default Username (admin) and Password (admin)
- Immediately change the Password for added security (SETTINGS→GENERAL). A strong password is required that is at least 8 characters with a lowercase letter, an uppercase letter, a number, and a special character.

#### GETTING TO KNOW THE THALES MANAGEMENT PORTAL

The Thales Management Portal is a Graphical User Interface (GUI) with an intuitive menu structure that is used to configure and monitor the MissionLINK system. The Management portal provides key information and status alerts about the operation and condition of the system and Iridium network. The Thales Management Portal is resident on the TU and can be accessed and viewed on almost any smart device or computer including phones, tablets, laptops, desktop computers, and the optional Thales SureLINK IP Handset. Restrictions apply on browser type and version. The menu structure and content will automatically scale to the device's screen size. The descriptions below are applicable for all devices but screen shots apply to larger display devices such as laptop computers. The actual view may vary depending on the size of the screen being used.

The Thales Management Portal is the primary user interface for the MissionLINK system. There are four access levels to the system. Three of them are under password control.

- Local access levels include GUEST access, which is for general users of the system that do not need to make configuration changes.
- The second local access is for administrators who need to view all data, perform software updates and make configuration changes.
- The first remote access level is for remote users who need to monitor the system, but no configuration changes are permitted. This is similar to the "guest" access except that it is a remote user instead of a local user.
- The second remote access level is for remote administrators such as Service Providers. This level allows for viewing all data and making configuration changes through the custom Thales Application Programming Interface (API).

The guest access level is not password protected, so when the Management Portal is opened, the guest user can view the current configuration and status of the system and any alerts that have been generated, but cannot change any parameters. The three other access levels are password protected. Passwords can be controlled and changed by the administrator in the SETTINGS  $\rightarrow$  GENERAL menu, where the local administrator is denoted as "admin", the remote user is denoted by "wan\_user" and the remote administrator is denoted by "wan\_admin". By password control, the local system administrator can enable or prevent any remote access to the system.

Administrators, after initially logging in to the admin account with default password (admin), can view all data and also make changes to all the configuration settings to customize the MissionLINK system. It is highly recommended that the administrator creates a new Password immediately after signing in for added security and protection. A strong password is required that is at least 8 characters with a lowercase letter, an uppercase letter, a number, and a special character.

In the following pages, the Thales Management Portal is described in detail. Read through the entire contents before attempting to configure the TU for the first time.

When you first enter into the Thales Management Portal, menu items appear on the left side of the screen (see Figure 3-1). Each of these menu items is discussed in the following sections. A short description of each menu item is below.

- Dashboard Provides information relating to any current Alerts and Services.
- Status Provides status of each of the items listed below. These informational screens cannot be edited.
  - Current Devices
  - o GPS
  - o LAN
  - Phones
  - Services
  - o SIM
- Alerts Provides a listing of system alerts
- Calls Provides current calls, call history, and call management.
- Emergency Allows the operator to send an emergency message.
- Settings Enables the Administrator to configure the system.
- System Enables the Administrator to perform system backups, view data usage, reset the system, and view/update system firmware.
- Diagnostics Enables the administrator to run a self-test, check system status, and view the diagnostics log.
- About Provides system level information for the antenna, modem, power supply, system, VoIP Module, and Wi-Fi.
- Help Provides a link to the MissionLINK User Documentation (Users Guide, Installation Instructions, and Quick Start Guide (QSG)).

Depending on the web browser being used, you may see a message that says NOT SECURE. If you type https://, this message will go away. This message does not affect operation of the management portal.

ភំ	LAN 1, 2, and 3 Status
۲	WAN Status
lio.	Satellite Signal Strength

### Table 4-1 Quick Link Icons

- System Status The System Status icon provides a quick view of the state of the system. It mirrors the status of the System LED on the TU. Selecting the System Status icon brings up the additional information in Figure 4-2.
  - STATUS shows the current condition of the system.
  - UPTIME indicates how long the terminal has been in use.
  - The RESTART button allows an administrator to reboot the terminal.
  - The SHUTDOWN button allows and administrator to shut down the TU, but this will require manual action to turn the BDU back on.
  - Selecting VIEW ALERTS opens the ALERTS window and displays any Current Alerts.

	🗘 System Status	×
	Status	ОК
6	Uptime	924 sec
17	Restart	Restart
	Shutdown	Shutdown
t		
		View Alerts Close

Figure 4-2 Quick Link – System Status

If the system requires a RESTART, the operator can simply press RESTART to reboot the terminal. Once the system has rebooted, verify that you are connected to the Wi-Fi for the terminal. Once you are connected to the terminal, you can login to the GUI by reentering the user name and password.

• Satellite Status – The Satellite Status icon provides a quick view of the Satellite Status. It mirrors the status of the Satellite LED on the TU. Selecting the Satellite Status icon displays the information in Figure 4-3, showing "Connection Status", "Signal Strength" and the "Current Data Path". Selecting ACTIVATE / DEACTIVATE enables and disables data sessions. Changes will take effect once SAVE CHANGES is selected. Selecting VIEW STATUS will open the STATUS → SERVICES Window.

🗞 Satellite Status	×
Connection Status	connected
Signal Strength	-112 dBm
Current Data Path	Yes
Data Session	Deactivate Activate
	View Status Close Save changes

Figure 4-3 Quick Link – Satellite Status

• Wi-Fi Status – The Wi-Fi Status icon (Figure 4-4) provides a quick view of the Wi-Fi status. It mirrors the Wi-Fi LED on the TU. Selecting the Wi-Fi Status icon displays the CONNECTED USER COUNT (number of users connected to the ThalesLINK Wi-Fi) and allows an administrator to ENABLE / DISABLE the Wi-Fi connection. Changes will only take effect once SAVE CHANGES is selected.

If connected to the terminal through a Wi-Fi connection, disabling the Wi-Fi causes loss of the Wi-Fi signal and removal from the wireless device's Wi-Fi menu. To regain use of the Wi-Fi, connect a computer via supplied Ethernet cable to the TU, open the Management Portal, select the Wi-Fi Status icon and select ENABLE.

	×
Network Name (SSID)	ThalesLINK_Cert
Connected User Count	0
WiFi Enabled	Disable Enable
	Close Save changes

Figure 4-4 Quick Link – Wi-Fi Status

• LAN Status Icons – The LAN Status icons (LAN 1, LAN 2 and LAN 3) provide a quick view of each LAN's Status. Each LAN icon is highlighted in blue when a device is plugged into it. By selecting a LAN icon, the additional information in Figure 4-5 is shown, displaying the "Link Status" and allowing for turning the Power over Ethernet (PoE) ON or OFF for that LAN, as well as enabling or disabling the PAN port. Only LAN 2 and 3 can be disabled. LAN port 1 is always enabled to prevent a situation where

the terminal cannot be accessed. Changes will only take effect once SAVE CHANGES is selected.

• Signal Strength Icon – Displays the satellite signal strength as 5 vertical bars. More bars are highlighted as the signal strength rises.

#### **Main Dashboard**

When first accessing the Management Portal by typing in http://portal.thaleslink (or https://portal.thaleslink)\_into a supported web browser, the Dashboard screen comes up by default. The Dashboard can also appear by selecting the top menu item highlighted in blue in Figure 4-7. From the Dashboard, you can see information relating to:

- Current Alerts
- Services

### Alerts

The ALERTS screen displays a list of active Alerts from the system. If no alerts exist, the alert screen will indicate that there are no active alerts. (Figure 4-14)

Figure 4-14 ALERTS Screen (Example Shown with No Active Alerts)

Alerts may be generated from a Power-On Self-Test (POST) or during normal operation of the system. (Figure 4-15) The alerts indicate that something may be wrong with the system or network. The alerts will clear if they are no longer affecting the system operation. (When cleared, the SYSTEM STATUS icon will turn **GREEN**.)

#### Emergency

Emergency Messages can only be configured by the administrator. If the user is not logged in as ADMIN and selects MANAGE EMERGENCY, the user will see icon, indicating this function is not available.

The Emergency Message (Figure 4-18) menu item allows for enabling and sending an emergency email message.

Selecting MANAGE EMERGENCY will open the SETTINGS  $\rightarrow$  EMERGENCY screen (Figure 4-22). From here, set up the Emergency Message by selecting Email from the drop down box. Once the required email information has been entered, including the message to be sent, select APPLY. For additional information, refer to SETTINGS  $\rightarrow$  EMERGENCY.

### Sending an EMERGENCY MESSAGE:

To send an EMERGENCY MESSAGE, press SEND EMERGENCY. A pop-up screen will appear asking you to confirm that you want the message to be sent. Select YES, SEND EMERGENCY to send or NO CANCEL to abort the message.

Confirmation Required						
Please confirm sending of	Please confirm sending of emergency message					
Yes, Send Emergency	No, Cancel					

Figure 4-20 Confirmation Required – Send an Emergency Message

No external indication is given when emergency is activated. This discretion is for user safety in an emergency situation. The only indication of an emergency will be in Management Portal under Emergency menu item.

An emergency phone call can be made by using the optional Thales SureLINK IP Handset. Configuration of the phone number to be called, as well as, the activation and cancellation of the call takes place on the handset itself. Nothing is set up for the phone call through the Management Portal.

#### Settings

The Settings tab of the portal is the most important section for customizing user configurations and feature settings. It is also advised that only experienced personnel change these settings as they may adversely affect functionality if not set correctly. These settings are under password control to prevent unauthorized personnel from making changes to the system.

#### General

From the General page, change passwords and enable (or disable) external API access, as shown in Figure 4-21 and Table 4-3.

There are four access levels to the system. Three of them are under password control. The passwords are managed in the Change Password section:

- GUEST: User only account, no password, read only access.
- ADMIN: Password capability, FULL access through the Thales Management Portal via local LAN (or wireless) connection.
- WAN ADMIN: Password capability, FULL access to all data and settings remotely via WAN port or over the Iridium network.
- WAN USER: Password capability, read only access to some API data remotely via WAN port or over the Iridium network.

The following default passwords for ADMIN, WAN\_ADMIN, and WAN\_USER are as follows:

### **<u>'E</u> <u>Default Passwords</u>:**

Username: admin Username: WAN\_Admin Username: WAN\_User Password: admin Password: NextAdmin Password: IridiumUser

It is recommended that passwords be changed from defaults for added protection and security. When changing the password from the default, a strong password is required that has at least 8 characters with a lowercase letter, an uppercase letter, a number, and a special character.

#### Emergency

On the Emergency page, the admin can set up an emergency message. The Management Portal configuration is restricted to an emergency email only. Select EMAIL from the pull down list (Figure 4-22). Enter the required information shown in Table 4-4 (example data shown in Figure 4-23) along with the message to be sent and select APPLY. NOTE: Selecting APPLY does not send an emergency message. It saves the settings and message. Sending the message is done through the EMERGENCY menu item.

Domain Whitelist & BlackList			
Domain Blocking	<b>OFF</b> / Blacklist / Whitelist ( <b>OFF</b> is the default setting)		
Mode			
Blacklisting	Enabling <u>allows ALL</u> websites EXCEPT those listed (very little restriction)		
Whitelisting	Enabling <u>blocks ALL</u> websites EXCEPT those listed (the most restriction)		
Port Blocking			
Port Blocking	<b>Disabled</b> / Enabled ( <b>Disabled</b> is the default setting)		
Whitelist Service	With Port Blocking Enabled, this allows for certain essential services		
	(Location Services, Emergency Services, and the Remote API) to stay		
	whitelisted/active and not be blocked. Check the services that are to		
	stay active. The whitelisted port is updated if the configured port for		
	that service is changed.		
Port Whitelist	Enter the Starting Port and Ending Port number.		
	Select the applicable protocol (TCP & UDP or TCP only or UDP		
	only) (TCP & UDP is the default setting)		
Data Usage			
System Data Usage	Data limit in kB (1000 bytes), 0 means no data and -1 means		
Warning Threshold	unlimited data. Setting data limits is for information purposes only.		
	No data restrictions will occur by setting limits.		
Reset Day	Enter the day of the month when usage should be reset, 0 means no reset		

*Table 4-5 Settings* → *Satellite* 

Setting data limits is for information purposes only. Data figures are an approximation of data usage. Actual data usage should be obtained by the service provider. Data will not be restricted if the limit is reached or exceeded. An alert will be generated saying that the limit has been reached.

### <u>Wi-Fi</u>

The Wi-Fi page shown in Figure 4-25 allows setup of the Wi-Fi service.

Figure 4-25 Settings → Wi-Fi Screen

Table 4-6 Settings $\rightarrow$	Wi-Fi
----------------------------------	-------

Section	Value
Wi-Fi General	
Enable Wi-Fi	Disabled / Enabled (Enabled is the default setting)
SSID	Enter the name of the SSID. ThalesLINK is default.
Broadcast SSID	Disabled / Enabled (Enabled is the default setting)
Wi-Fi Channel	Set the Wi-Fi Channel 1 – 11
Security Mode	Set the security mode for the channel – <b>OPEN</b> or WPA2. <b>OPEN</b> is
	default and does not require a Security Key (password).
Security Key	When WPA2 is selected as the security mode, a security key must be
	entered. The password must be at least 8 characters in length and can
	be any combination of characters, numbers, etc. Once enabled, any
	device accessing the ThalesLINK (or new SSID name) Wi-Fi will
	have to enter the password.
Wi-Fi Device Whitelis	st
Device Whitelist	<b>Disabled</b> / Enabled ( <b>Disabled</b> is the default setting)

Section	Value		
Whitelist	This allows specific devices to access the system's Wi-Fi. If Enabled,		
	only the devices entered in the Whitelist are allowed on the Wi-Fi		
	network. This is done by entering the MAC address of the device		
	(example: 01:23:45:67:89:ab). All others are prevented from accessing		
	it. See below note for finding a device's MAC address		
	Assign a Nickname to the MAC Address		

Once the initial Wi-Fi WPA2 Security Key is entered, it can be changed at any time by just overwriting the current Security Key in the SETTINGS  $\rightarrow$  Wi-Fi  $\rightarrow$  WIRELESS GENERAL area.

To identify a device's MAC address for whitelisting, you should be able to find it in your device's Settings menu. Sometimes it is called the Wi-Fi Address. If it cannot be found, a simple way is that while the Device Whitelist is DISABLED, connect the device to be whitelisted to the Wi-Fi system by selecting the correct Wi-Fi Network (SSID) and typing in the Security Code if WPA2 is enabled. Once connected, go to STATUS  $\rightarrow$ CURRENT DEVICES menu item and find the device Hostname in the list of Allocated IPs. The MAC address will be in the left column.

Changing the SSID disrupts the current connections so some Wi-Fi connections are dropped. The behavior is device dependent and will appear to be different for each device. Refer to Table 6-1 for additional information.

LAN

This is an ADMIN functional only. If the user sees this  $\bigotimes$  icon, login as the ADMIN to continue. Otherwise this is a view only screen.

The LAN page, shown in Figure 4-26, allows PoE to be enabled or disabled on the three LAN ports and DHCP to be enabled and configured or disabled. Each LAN port PoE is Class 2 and capable of providing up to 6.5 watts of power to the connected device. See Table 4-7 for more information on the information that is entered.

Please use "portal.thaleslink" as the NTP server.

Changes to DHCP or LAN MAC address will take up to a minute to process. Data will be unavailable during this time.

Table 4-7 Settings  $\rightarrow$  LAN

WAN

This is an ADMIN function only. If the user sees this  $\bigotimes$  icon, login as the ADMIN to continue. Otherwise this is a view only screen.

The WAN page, shown in Figure 4-27, allows configuration of the WAN data service. The settings include configuring whitelists and blacklists for domains, configuring port blocking and port whitelists.

Caches local to the computer connected to the ThalesLINK terminal will continue to allow data access to blacklisted domains until their DNS cache entry expires. To help this take effect sooner, clear the local DNS and web browser caches after switching between the WAN and Satellite connections or adding new entries to the blacklist.

If a WAN Modem connection is changed, it is important to remember that the terminal unit will need to re-started.

Changes to WAN configuration will take up to a minute to process. Data will be unavailable during this time.

Additional details about these settings are described in Table 4-8.

Phone

This is an ADMIN functional only. If the user sees this  $\bigotimes$  icon, login as the ADMIN to continue. Otherwise this is a view only screen.

The Phone Settings page, shown in Figure 4-28, allows configuration of phone extensions and mapping of those extensions to the outbound Iridium phone lines as well as which extension rings for each inbound Iridium line. There are up to three (3) high quality Iridium phone lines. Each extension can be mapped to one, two, three or none of the Iridium phone lines for outbound calls by checking the box next to the corresponding Line in the Outbound Lines column. By

selecting the *local* icon, a password can be entered for each extension if desired. An extension

can be deleted by selecting the icon. All changes are saved only after the APPLY button is selected.

Each of the three Iridium phone lines (Inbound) can be mapped to ring only one extension. The extension is selected from the pull-down menu. Configuration of analog devices such as the POTS phones and the Radio Gateway are configured on this page. Each of these devices can be mapped to an extension.

Finally, in the Phone Configuration area, call logs can be enabled or disabled and the POTS phone impedance can be selected for optimal performance.

When adding an extension, it is always necessary to first select the <b>t</b> button BEFORE
selecting the button. Several extensions can be added by selecting the total button
multiple times, and then selecting the button. After selecting the button, the
extension can always be edited or deleted selecting the buttons BEFORE selecting the
Apply Letter to Letter Apply Letter is not a last of the Constant of the Discourse the

button to save. If the button is not selected before leaving the Phone menu item, the data will not be saved. Table 4-9 describes the settings in more detail.

NOTE

Changes to Extension management will take up to a minute to process. Data will be unavailable during this time.

#### **VoIP Phone Settings**

The two VoIP phones that Thales recommends include the CISCO SPA504G and the Grand Stream GXP2140. Other phones may work with the MissionLINK terminal, however the functionality cannot be guaranteed.

The two sections below include general recommended settings for the user to get up and running with the VoIP phones.

- **CISCO SPA504G** -- The first section shows how to configure the CISCO SPA504G on the pre-configured extension 1001.
- **GRAND STREAM GX2140** -- The second section shows how to configure the Grand Stream GXP2140 on extension 1002.

#### CISCO SPA504G

This procedure assumes that the MissionLINK Terminal is starting from its factory reset state and that the CISCO SPA504G phone is also in its factory reset state. Note, most of the initial settings for the CISCO phone stay as they are. Only a few of the settings are required to change as outlined in the steps below.

- 1.) Connect the CISCO phone to one of the RJ-45 LAN ports on the front of the MissionLINK Terminal.
- 2.) View the Management Portal (http://portal.thaleslink or https://portal.thaleslink). Note that the SETTINGS →PHONE extensions 1001, 1002, and 1003 are pre-configured as shown in Figure 4-29.

Figure 4-31 SPA504G Configuration Utility

The CISCO SPA504G phone should be ready for calls after these steps.

#### **GRAND STREAM GXP2140**

This procedure assumes that the MissionLINK Terminal is starting from its factory reset state and that the GRAND STREAM GXP2140 phone is also in its factory reset state. Note, most of the initial settings for the GRAND STREAM phone stay as they are. Only a few of the settings are required to change as outlined in the steps below.

- 1.) Connect the GRAND STREAM phone to one of the RJ-45 LAN ports on the front of the MissionLINK Terminal.
- 2.) View the Management Portal (http://portal.thaleslink or https://portal.thaleslink). Note that the SETTINGS →PHONE extensions 1001, 1002, and 1003 are pre-configured as shown in Figure 4-31 above.
- 3.) In order to bring up the phone's configuration page in a browser, one needs to find the IP address of the connected phone. This is accomplished by going to the Management Portal and entering STATUS → CURRENT DEVICES. In this example, the GRAND STREAM GXP2140 has an IP address of 192.168.55.102 as shown in Figure 4-30 above. It may take process of elimination to find out what the IP address is.
- 4.) Using a web browser, use the IP address found in step 3 to go to the GRAND STREAM GXP2140 phone configuration page. Login as an Administrator and go to ACCOUNTS→Account 1→General Settings as shown in Figure 4-32 below.
  - a. In the SIP Server field, enter "sip.thaleslink".
  - b. In the SIP User ID, the Authenticate ID and Authenticate Password, enter "1002".
  - c. When finished, press the "Save and Apply" button. See Figure 4-32 below for the entries above.

The GRAND STREAM GXP2140 phone should be ready for calls after these steps.

#### SureLINK Handset

The SureLINK Handset is an accessory that is sold separately and has its own user manual (84481), so reference that for operational guidance.

This section of the manual details how to install, update, or uninstall SureLINK apps that are provided in the MissionLINK system through software updates. Figure 4-33 shows two options for App management on the SureLink, Automatic or Manual. To edit either, its respective button needs to be selected, and then select Apply.

Detection of a connected SureLINK is done internally and automatically. The SureLINK must be plugged in and turned on for Applications to be installed.

<sup>E</sup> Neither the LINK app nor Adobe Acrobat can be uninstalled or updated through this feature. Third party applications can be uninstalled.

Automatic mode allows users to modify any SureLINK connected using the designated Settings. The specified settings will apply to all connected SureLINKs if automatic mode is enabled.

Manual mode allows users to affect changes on a specific SureLINK device. Each SureLINK is displayed on the page with its own panel, and the user can choose whether to install, uninstall, or upgrade apps on each SureLINK.

Currently, for this feature, only the ESChat Push-To-Talk (PTT) application is supported on the SureLINK. The Application's name and version supported by the MissionLINK system is listed here along with the option to change its installation status.

*Figure 4-34 Settings* → *SureLINK Handset Manual App Configuration* 

In Figure 4-33 and Figure 4-34, the screen shot shows that a SureLINK is currently connected. Otherwise, it will display a message that says "No handset devices are currently connected".

Section	Value
General	
Application	Automatic / Manual
Configuration	
Automatic Settings	
Name	
	The name of the Application as it appears on the MissionLINK
Version	Version of the App as it appears on the MissionLINK.
Desired Status	<b>No Change</b> , Install, and Uninstall. This determines how the SureLINK will be modified when connected. If No Change is
	selected, nothing will occur. Install means the Version of the
	Application seen will always be put on the SureLINK. This applies to
	upgrades as well. Uninstall will always uninstall the app if it is seen
	on the SureLINK, no matter the version.
Devices (Automatic	
Name	The name of the SureLINK, typically 'android-' followed by a string
	of numbers or letters.
IP Address	The IP address of the SureLINK
MAC Address	The MAC address of the SureLINK
Status	Status of the SureLINK (online or offline)
Туре	The type of Handset, aka SureLINK
SureLINK 1 (Manua	al Configuration)
Name	The name of the SureLINK, typically 'android-' followed by a string of numbers or letters.
Address	The IP address of the SureLINK
MAC	The MAC address of the SureLINK
Status	Status of the SureLINK (online or offline)
Application	The name of the Application as it appears on the MissionLINK
Version	Version of the App as it appears on the MissionLINK.
Available Version	Version of the App as it appears on the MissionLINK
Desired Status	Install/Update, or Uninstall
	Install/Update will put the latest available version of software on the
	SureLINK. If the Application is not already on the SureLINK, Install
	will be seen instead of <i>Update</i> here, and the user can install the latest
	version of the application on the SureLINK. If no version for the
	application software exists on the MissionLINK, the Install/Update
	button will be grayed out and not selectable.
	<i>Uninstall</i> removes the specific App from the SureLINK and will always be an available option.
	unays se un avanable option.

*Figure 4-35 Settings* → *Radio Gateway* 

<b>S 4</b> <sup>2</sup>	Table 4-11 Settings → Radio Gateway
Section	Value
<b>Configuration</b>	
Transmit VoIP Gate	
Mode	DTMF or Voice Activated Dialing (VAD) (VAD is the default setting). This configuration determines how the telephony user of the radio gateway PTTs in order to speak on the radio network. VAD means the telephone user simply needs to speak in order to transmit. DTMF requires the telephone user to press a digit to begin transmitting and a digit to stop transmitting.
DTMF: ON Digit	Valid DTMF digits range from "0" thru "9", "*", "#". (The default digit is "*".) Dialing the selected digit will cause the radio to start transmitting
DTMF: OFF Digit	Valid DTMF digits range from "0" thru "9", "*", "#". (The default digit is "#".) Dialing the selected digit will cause the radio to stop transmitting.
VAD: Voice Hang	VAD Voice Hang Time determines how long the telephone user's
Time	voice transmission will continue after the voice is no longer present. Acceptable value range is 0 to 5000 msec. (Default setting is <b>500</b> msec).
Transmit Audio	
Delay	Sets the delay being applied to the transmit audio (when VoIP is VAD). Acceptable values range from 0 to 500 seconds. (Default setting is <b>300</b> msec).
Analog Gain	Sets the gain (in dB) applied to the hardware in the radio to transmit audio. Acceptable values -20 to 20 dB. (Default setting is -20 dB).
Digital Gain	Sets the gain (in dB) applied to the software in the radio to transmit audio. Acceptable values -40 to 20 dB. (Default setting is <b>-20</b> dB).
VAD: Threshold	For VAD mode, controls the sensitivity of voice detection on outgoing telephone user's audio. Acceptable values -40 to 20 dBFS. (Default setting is -35 dBFS)
Transmit / Radio PT	Г
Active Level	<b>Enabled</b> / Disabled, ( <b>Enabled</b> is the default setting). This setting should be adjusted to match the connected radio, depending on if the connected radio has external PTT as ENABLED or DISABLED in order to transmit.
Timeout	The maximum amount of time, in seconds, that PTT to the radio will be continuously asserted. After this timeout expires, the radio will be de-keyed until the telephony user causes it to begin transmitting again.
<b>Receive Activity</b>	
Mode	The mechanism used to detect receive activity from the radio (a.k.a., channel busy or COR)—either via the presence of voice or the assertion of the hardware COR input pin (GPIO). Select <b>VAD</b> or GPIO (Default setting is <b>VAD</b> ).

*Table 4-11 Settings*  $\rightarrow$  *Radio Gateway* 

Section	Value
VAD: Hang Time	If Receive Activity Mode is set to "VAD", the Hang Time determines how long the voice transmission will continue to be received after the voice is no longer present. Acceptable value range is 0 to 5000 msec. (Default setting is <b>500</b> msec).
GPIO: Active Low	If Receive Activity Mode is set to "GPIO", set the GPIO Active Level to either High or Low (Default setting is <b>Low</b> ).
Receive Audio	
DTMF: Threshold	For DTMF mode, controls the sensitivity of tone detection on incoming DTMF. Acceptable values -35 to 0 dBFS. (Default setting is -20 dBFS)
VAD: Threshold	For VAD mode, controls the sensitivity of voice detection on incoming audio. Acceptable values -40 to 20 dBFS. (Default setting is -35 dBFS)
Analog Gain	Sets the gain (in dB) applied to the hardware in the radio to receive audio. Acceptable values -20 to 20 dB. (Default setting is <b>0</b> dB).
Digital Gain	Sets the gain (in dB) applied to the software in the radio to receive audio. Acceptable values -40 to 20 dB. (Default setting is <b>0</b> dB).
Calling	
DTMF Dialing Phrase	Phrase of DTMF digits which, when received from the radio, will cause the RGW to enter dialing mode. Subsequent digits will be accumulated into a phone number buffer, and a call will be placed to that number once the user stops dialing. Acceptable values are any string of valid DTMF digits (0-9, *, #) (Default setting is "**")
DTMF Disconnect Phrase	Phrase of DTMF digits which, when received from the radio, will cause any ongoing call or operation to terminate. Acceptable values are any string of valid DTMF digits (0-9, *, #) (Default setting is "##")
Digit Timeout	When the radio user is entering a number in dialing mode, how long to wait, in seconds, after receiving a DTMF digit before concluding that the user is done entering the target number. After this timeout elapses, a call is attempted to the target number. Acceptable values $\geq 0$ sec. (Default setting is <b>3 sec</b> )
Max Digits	The maximum length of a phone number that may be entered by a radio user in dialing mode, including any prefixes such as country code and external calling access digit. The phrase used to initiate dialing (e.g., "**") does <b>not</b> count towards the maximum number of digits. Acceptable values $\geq 0$ . (Default setting is <b>20</b> )
Dialing Duration	When a radio-initiated outbound call is being placed, a burst of ringback tone is transmitted to the radio user for this amount of time as confirmation. Acceptable values $\geq 0$ msec. (Default value is <b>1000</b> msec).
Disconnect Duration	When an active call is hung up, a burst of busy tone is transmitted to the radio user for this amount of time. Acceptable values $\geq 0$ msec. (Default value is <b>2000</b> msec)

Section	Value
Error Duration	When an outbound call fails or an active call ends prematurely due to
	an error, a burst of fast-busy tone (a.k.a. congestion tone) is
	transmitted to the radio user for this amount of time. Acceptable
	values are $\geq 0$ msec. (Default value is <b>2000</b> msec).
Answer Timeout	After an outbound call has been placed, how long to wait for the peer
	to answer before giving up and terminating the call. Note that the call
	attempt may terminate before this timeout is reached if an error is
	encountered. Acceptable values are $\geq 0$ sec. (Default value is <b>60</b> sec).

<u>Data</u>

This is an ADMIN function only. If the user sees this  $\bigotimes$  icon, login as the ADMIN to continue. Otherwise this is a view only screen.

From the Data page, shown in Figure 4-36, data is enabled or disabled and the routing is configured. The data can be configured to always go through the Iridium satellite system, always go through the WAN port or go through both, depending on availability of the WAN network.

The WAN port does not have Power over Ethernet (PoE) capability, so any device plugged into the WAN port needs to provide its own power source.

The automatic data routing feature does not apply to voice calls. All voice calls are routed through the Iridium satellite system 100% of the time. The WAN port is only for data.

Section	Value
<b>Data Configuration</b>	
Data Session	Deactivate / Activate (Activate is the default setting)
Data Route - Primary	Select the desired data route (WAN or Satellite Port) (WAN is the
	default setting).
Data Route -	Select the desired alternate data route. (Satellite is the default setting)
Alternate	Note: If Satellite is selected, the available options are WAN Port or
	Disabled.
	If WAN Port is selected, the available options are Satellite or
	Disabled.
Disable Data on Boot	NO / YES (NO is the default setting). Determines the default data
	operations state when the system is restarted.
<b>Port Forwarding</b>	
Port Forwarding	Enter the External Port, Internal Port, Internal IP Address, and
	Protocol. Up to seven ports can be forwarded in the range of 1 -
	53247. Ports greater than 53247 cannot be forwarded

Section	Value
<b>Protocol Forwarding</b>	
Protocol Forwarding	Enter the GRE Internal IP Address and/or the ESP Internal IP Address.

"Disable Data on Boot" allows the operator to manually set the data session to ON whenever the unit is powered on.

#### Secondary Data Flow (SDF)

This is an ADMIN function only. If the user sees this  $\bigotimes$  icon, login as the ADMIN to continue. Otherwise this is a view only screen.

A Secondary Data Flow (SDF) connects a port on the terminal to a service on the network. The device connects directly to the service without interference from the terminal.

The ports and/or Wi-Fi can be configured in Map mode to route all untagged packets on a physical or virtual port directly to the SDF provisioned service.

Ports and Wi-Fi can be configured in VLAN Tag mode, which provides access to all provisioned SDFs. If the incoming packets are tagged with a valid, provisioned VLAN tag, the packets are routed directly to the associated SDF. See below for tagging information. Untagged data will be routed to the default data flow.

Internal Services (virtual ports) can only be mapped to SDFs. The virtual ports cannot be tagged.

SDFs: An SDF cannot be assigned to a Port and a Service simultaneously. However, the same SDF may be assigned to multiple ports or multiple services.

Virtual and physical ports must remain separate. Multiple ports can be mapped to the same SDF or packets tagged for the same SDF from different devices. An SDF assigned to a virtual port cannot be used by a physical port and a physical port cannot be used by a virtual port. This also means data on a VLAN Tag port will not be routed down an SDF in use by a virtual port.

At least one physical LAN Port must be configured in either Default or Bridge mode.

State	Deactivate/Activate, Turns on or off SDF Y		
Service Networks	Each service can be deactivated individually. When active, an		
	arbitrary name and the destination subnet are required.		

Table 4-13 Settings → Seco	ondary Data Flows
----------------------------	-------------------

SDFs: Each SDF can be deactivated individually. GRE, ESP, and DHCP can be routed through an SDF as done previously in the data tab. Port forwarding is also supported through an SDF as done previously in the data tab.

SDF requires the Service Provider (SP) to associate a SIM with a service provided by the SP through an SDF.

E For example, LAN Port 2 on the terminal can be associated with a corporate Virtual Private Network and LAN Port 3 can be associated with the internet for crew welfare.

A SP can use an SDF to route Location Services messages directly to a Location Services server and count the data for that service separately.

The user cannot select an unprovisioned SDF. These are grayed out and may only be assigned through the API.

Figure 4-38 Settings  $\rightarrow$  Global Navigation Satellite System

Section	Value			
Global Navigation Satellite System				
Enable GNSS	Select Disable or <b>Enable</b> . ( <b>Enable</b> is the default setting) When the setting is changed, the system requires a reboot (refer to Figure 4-37).			
Select Constellations	Select up to three GNSS satellite constellations to receive positioning and timing data from. <b>GPS</b> is the default. When multiple constellations are chosen, the terminal uses the system with the best signal for position data. Note: When BeiDou and GLONASS are both selected, no other constellations can be selected.			
Synchronize Time				
Synchronize Time	Synchronize time is only used when the terminal's system time is incorrect, GNSS is disabled, and the GNSS cannot be enabled for security purposes or operational reasons. (Note: When performing a software upgrade and a failure occurs, synchronizing the terminal's time will often solve the problem.)

<u>GPIO</u>

This is an ADMIN function only. If the user sees this  $\bigotimes$  icon, login as the ADMIN to continue. Otherwise this is a view only screen.

For more information about the pinout of the DB-15 GPIO connector, see Figure 7-4. Refer to the tech note, produced by Thales, for information on applications and physical connections of the DB-15 connector.

This section describes how to configure two general purpose GPIO pins, pins 6 and 13, located on the DB-15 connector on the rear of the BDU (see Figure 7-2). This configuration includes activating the pins with output voltage of about 3.3V, setting the pins as an input and reading the applied voltage value, and a satellite connectivity status feature. A "high" reading indicates that the input pin is reading about 3.3V, and "low" indicates a reading of about 0V. The two pins can be configured in any combination.

If a pin is set to *Input*, the maximum voltage applied should be 3.3VDC. Higher voltages could damage the BDU.

#### Location Services

From the Location Services page, shown in Figure 4-39, Location Services are enabled and disabled and the settings are configured (when enabled). A Location Services server is required to interact with Thales's open protocol. Contact Thales Customer Support for details.

Figure 4-42 Settings → Location Services Screen

Section	Value		
<b>Location Services</b>			
Enable	<b>Disabled</b> / Enabled ( <b>Disabled</b> is the default setting)		
Server	Enter the name of server.		
Port	Enter the port number of the service from server.		
Report Frequency	Default setting is 120 seconds. When EMERGENCY is activated,		
	frequency will be every 5 seconds.		

#### System

The System menu item allows for backing up a configuration and restoring it, monitoring of system data usage (estimate for informational purposes only), performing a system reboot, restoring factory default settings, and provides information on the system firmware versions.

Backup

This is an ADMIN function only. If the user sees this  $\bigcirc$  icon, login as the ADMIN to continue. Otherwise this is a view only screen.

Refer to Figure 4-43. When performing a firmware update, replacing a TU, cloning information for multiple systems or just as good practice periodically, the system configuration file should be backed up to prevent loss of custom configuration settings in the event that an issue should occur. Backup can occur on devices that have a file system where the configuration file can be downloaded and saved (personal computer, laptop, Android). Backing up the current configuration is a simple process detailed below.

• Backup Configuration

- Connect a computer to the TU either through Ethernet or Wi-Fi
- Select BACKUP, will automatically backup the data contained in the Management Portal.
- The backup file can be renamed as long as the file extension is ".json" NOTE: This is very useful for restoring settings to a replacement unit or cloning setup for multi-units.
- Restore Configuration
  - In the event the configuration file needs to be reloaded, RESTORE CONFIGURATION will enable you to reload a previous saved configuration file.
  - Select RESTORE CONFIGURATION
  - Navigate to the file that was saved.
  - Open the file to Upload

Config files dating back to software version 2.1.0 are supported. This will apply for future software releases unless otherwise noted.

Data Usage

This is an ADMIN functional only. If the user sees this  $\bigotimes$  icon, login as the ADMIN to continue. Otherwise this is a view only screen.

Refer to Figure 4-44. Data usage is shown for information purposes only. If there is a data limit set, this information will be provided on this screen. Satellite Data Session is the data used since the last power-up. Satellite Data Total is the data used since the last reset (manual or automatic). The system data usage can be reset to restart the data count. Select RESET and then YES, RESET to confirm. Otherwise, select NO, CANCEL (Figure 4-45). For Satellite Data Limits – pressing the VIEW SATELLITE LIMITS button, will bring up the SETTINGS  $\rightarrow$  SATELLITE Screen (Figure 4-24).

This is an estimate of data used and does not accurately represent the billable data total. It also does not limit or restrict data usage even if the Data Usage exceeds the Data Cap. To get accurate data usage, please contact your service provider.

#### Reset

This is an ADMIN function only. If the user sees this  $\bigotimes$  icon, login as the ADMIN to continue. Otherwise this is a view only screen.

Refer to Figure 4-46. In the event the system is not responding correctly, a system reboot can be performed. Select REBOOT to restart the system.

The SHUTDOWN button allows and administrator to shut down the BDU but this will require manual action to turn the BDU back on.

If there is a larger issue such as a corruption or if configuration settings have made the system non-operational, a Factory Reset can be performed. Select FACTORY RESET. This resets all the configuration settings to the default settings.

Backup Version will revert the system to the previous software version.

### CHAPTER 5 FIRMWARE UPGRADE

On occasion it may be necessary to update MissionLINK software to add features or fix issues found in the software. This section will step through the process of those updates. The firmware file will contain updates for both the TU and the antenna if needed, so a single load automatically updates both. It is important to make sure the system is connected, powered up, and operational before attempting a firmware update. *Do not remove power from the TU or remove the antenna connection while an update is in process.* This may cause a corruption to occur and force reverting to the previous software version.

For SW reset or returning to factory defaults please refer to Chapter 6  $\rightarrow$  RESETS.

#### **INSTALLING THE FIRMWARE ON MISSIONLINK**

#### Via Computer or Mobile device.

- 1. With PC or Mobile Device connect to "ThalesLINK" on Wi-Fi or via Ethernet (RJ-45) port.
- 2. Open a web browser and type: http://portal.thaleslink (or https://portal.thaleslink)\_(do not type .com or any other extension)
- 3. Once prompted enter Username and Password.
- 4. Navigate to the SYSTEM  $\rightarrow$  Firmware (Figure 5-1)

### CHAPTER 6 MAINTENANCE

#### GENERAL

This chapter provides operator maintenance instructions for the TU and BAA. This includes, preventive maintenance and troubleshooting procedures.

### **PREVENTIVE MAINTENANCE**

#### **Inspection and Cleaning**

The equipment should be occasionally inspected for external damage, such as bent connectors and wear items, such as loose attaching hardware. The equipment should be cleaned periodically, particularly after exposure to salt water, sand, or mud. With the TU turned off, use a slightly damp rag (water only) to clean the TU and/or BAA. If water ingress is detected, air dry (or dry with low pressure air (if available)) to allow the unit to dry prior to applying power.

#### TROUBLESHOOTING

PROBLEM	SOLUTION
Satellite LED Flashing GREEN	<ul> <li>Flashing GREEN light indicates that it is acquiring the satellite. If it continues to flash for more than 5 minutes, check that the antenna has a clear view of the sky.</li> <li>Reboot TU.</li> </ul>
Satellite LED Flashing RED	<ul> <li>Critical Fault Detected. Open Management Portal <u>http://portal.thaleslink</u> (or <u>https://portal.thaleslink</u>) and check Alerts. Make any adjustments. (For example: check antenna connection, or GPS not acquired.)</li> <li>Turn unit off and on again. If same result, contact your service provider.</li> </ul>
ථ System LED Flashing Green	<ul> <li>Start-up in progress. Wait until unit has run diagnostics and completed start procedure. This may take more time than usual when acquiring satellites for the first time</li> <li>Switch power off and back on if the light doesn't turn solid green after 5 minutes.</li> </ul>
じ System LED Solid YELLOW	• The unit has a warning indicating a minor issue that should not affect performance. Open the management portal, check alerts, and make any adjustments needed.

PROBLEM	SOLUTION
ひ System LED Flashing RED	<ul> <li>Fault Detected. Open Management Portal <u>http://portal.thaleslink</u> (or <u>https://portal.thaleslink</u>) and check for alerts. Make any adjustments. (For example: Common alerts include, but not limited to, are the SIM Card not installed, SIM Card not provisioned. Power-Up Test (POST) failure.)</li> <li>Turn unit off and on again. If same result, contact your service provider.</li> </ul>
O System LED Flashing MAGENTA	• A defective fault is detected. This is associated with a processor not booting correctly. If system reboots, factory resets, or software reverts don't clear the issue, contact your service provider.
🛜 Wi-Fi LED	<ul> <li>OFF – Turn Wi-Fi ON using the Management Portal through a hardwired, PoE connection. ThalesLINK &gt; Settings &gt; Wi-Fi</li> <li>Solid RED – Wi-Fi may need to turned off and back on again from the Management Portal. If the LED does not turn to GREEN within a minute, reboot the TU.</li> <li>Flashing GREEN – If this continues for more than a minute or two, check for NO OR WEAK Wi-Fi</li> </ul>
Call Logs are not appearing	• Call logs must be enabled. Verify call logs are enabled (SETTING → PHONE → PHONE CONFIGURATION)
Calls unexpectedly drop when using Gateway	• Verify that the Gateway number is not assigned to any other phone. If it is, your Gateway call may drop unexpectedly. To correct this, remove the duplicate number.
Cannot connect to the internet	• Data sessions default is OFF. Check to make Satellite Data Sessions is ACTIVATED on Dashboard. If not, select ACTIVATE and then APPLY next to SATELLITE DATA SESSION.

PROBLEM	SOLUTION
	• You may need to clear your browser cache.
	Ensure Terminal Unit is powered ON
Cannot connect to the Management Portal	<ul> <li>Ensure Wi-Fi is enabled and connected to ThalesLINK (or renamed SSID). If using a Wi-Fi enabled device, the Wi-Fi LED on the TU should be solid GREEN. If not using Wi-Fi, ensure Cat 5 cable is connected to one of the three Ethernet ports (NOT WAN or POTS Port). If Ethernet connection, replace the cable and re-check connection</li> <li>Open web browser and type <a href="http://portal.thaleslink">http://portal.thaleslink</a> (or <a href="https://portal.thaleslink">https://portal.thaleslink</a> (or <a href="https://portal.thaleslink">https://portal.thaleslink</a></li></ul>
	• If system LED is flashing GREEN, wait until it turns solid GREEN, then try reconnecting to the portal.
Cannot connect to Wi-Fi service	<ul> <li>Check that the Wi-Fi antenna is attached and tightly screwed in.</li> <li>Check that the TU's Wi-Fi LED is solid GREEN.</li> <li>Check to see if there's an available connection by checking the devices that are connected in Status → Current Devices page.</li> <li>Only 3 simultaneous devices can connect to the Wi-Fi. Any additional connection attempts are blocked.</li> <li>Remove one or more devices from the Wi-Fi and try again to connect.</li> <li>Use the Wi-Fi Device Whitelist to limit access to specific wireless devices.</li> <li>Verify that the SSID has NOT been disabled. If disabled, enable the SSID. If the device does not "automatically" reconnect, then manually reconnect by adding the network on the device. Refer to device user manual for instructions on how to do this.</li> </ul>
Network Error	• If you receive a message similar to this, another user is attempting to use the same IP Address as your computer.

PROBLEM	SOLUTION
No or Weak Wi-Fi Signal	<ul> <li>Connect Wi-Fi antenna and ensure it is secured tightly</li> <li>If walls or metal obstructions are between the TU and the Wi-Fi device, move closer to the TU or move the TU to a better location with less obstructions</li> <li>Check to make sure Wi-Fi device is connected to the TU's Wi-Fi and verify that you are connected to the ThalesLINK.</li> <li>Check the Management Portal to make sure the Wi-Fi device is registered as a user.</li> <li>Check signal bars at the top of the Management Portal. If no</li> </ul>
MissionLINK is not obtaining a satellite signal (Satellite LED is red)	<ul> <li>bars are highlighted, the satellite is not being detected. Wait a few minutes to see if the signal strength improves as another satellite comes into view.</li> <li>Check antenna connection at the TU and antenna. Make sure no corrosion has occurred on the cable connections to the antenna and that the connectors are screwed in tightly.</li> <li>Check antenna for a clear view of the sky with no obstructions. Relocate antenna if needed.</li> <li>Check for interferers in the area that could be affecting the signal such as active radars, VSAT systems and other radio antennas. Turn those off and retest.</li> <li>Move vehicle to a new location and retest if other interfering vehicles are in the area</li> <li>Reboot TU and check the Alerts.</li> <li>Call Service Provider if the satellite connection is still not working.</li> </ul>
Terminal Unit does not Power-ON	<ul> <li>Check TU for Green lights, If green light is on Unit has Power</li> <li>Push power button on front of TU.</li> <li>Check that the power source is providing 10-32V and is not current limited.</li> <li>Check connection of the 10-32V DC cable has correct polarity.</li> <li>Check to ensure Ignition line is connected to switched line or connected to Red (Positive line) for continuous operation.</li> <li>Check that ignition or remote switch is turned on if ignition line is connected.</li> <li>If using AC/DC converter, make sure the AC outlet has power and that the plug is securely in the AC outlet and the other end is securely connected to the TU.</li> </ul>

PROBLEM	SOLUTION
Terminal Unit has power but accessories not working	<ul> <li>Remove power from accessories and disconnect from TU. Restart TU using the power button or remove power from TU for 10 seconds. After TU has rebooted re-attach accessories. (Note: This applies to all accessories, EXCEPT the antenna. Do not disconnect the antenna while booting up the system.)</li> <li>If PoE accessory not receiving power, make sure PoE is enabled for that port.</li> <li>PoE is not available on WAN port. Any device on WAN port needs its own power source.</li> <li>Check VoIP phone manuals for proper configuration. Each phone may have a different configuration method.</li> </ul>
Terminal Unit is not responding	<ul> <li>Check LED status on TU or on Management Portal. Make sure there are no RED LEDs. Check for Alerts in Management Portal by selecting the Alerts menu item.</li> <li>Reboot the system and recheck for any Alerts that may have been generated.</li> <li>Call Service Provider if the TU is still not responding.</li> <li>As a last resort, use the manual reset button, located below Wi-Fi antenna port, using a straightened paper clip or similar sized article insert into port and push reset button. <u>NOTE:</u> This is not recommended as a routine troubleshooting measure. All user data and debug information will be lost and factory defaults returned.</li> </ul>

### System Resets

In a rare situation where the MissionLINK system is not responding or operating properly, it may be necessary to reset the system. There are varying levels of system resets that are explained below:

#### Power Cycle

There are four (4) ways to power cycle the system:

• If power is already on (LEDs are illuminated), press and hold the Power Button on the unit until the unit turns off. Again, press and release the Power Button to power the unit on. It will take a few minutes before the boot-up cycle completes.

Figure 6-1 Location of Power Button on Terminal Unit (TU)

- From the Management Portal, select SYSTEM → RESET→ REBOOT DEVICE. Press REBOOT. It will take a few minutes before the boot-up cycle completes.
- From the Management Portal, select SYSTEM → RESET→ SHUTDOWN. Press SHUTDOWN. The system will turn off but not boot back up. Pressing the Power Button will turn the system back on.
- If neither of these work, then unplugging the system from the power source may be necessary. Note: Always wait at least 20 seconds for power inside the unit to dissipate before reconnecting the input power.

*Figure 6-2 Management Portal - SYSTEM* → *RESET* 

#### Factory Reset

As its name implies, this restores the factory defaults (passwords will return to "admin"). This is particularly helpful when a system has been wrongly configured and starting over is the easiest option. If an admin password is customized and is forgotten, the only way to reset it is to use the factory reset option. After clearing all the user configuration, it will reboot the terminal a couple of times to reset the internal components correctly. This may take several minutes. Once it is complete, the System Status LED will be solid green. You can then log into the Management Portal using the default password and change settings as desired.

Factory Reset can be accomplished by either of these two actions:

• Remove the SIM card cover exposing the reset hole. Power up the TU and wait until the System LED stops blinking green. Using a straightened paperclip, insert it into the round hole just to left of the SIM card as shown in Figure 6-3. Push straight in **gently** until the paperclip causes the switch to click and hold until LEDs flash. A factory reset will occur which takes up to 5 minutes until the system is reconfigured and boots up completely.

Figure 6-3 Reset Button

• From the Management Portal select SYSTEM → RESET→ FACTORY RESET. Confirm by selecting YES, FACTORY RESET. A factory reset will occur.

#### Firmware Revert

FIRMWARE REVERT should only be used when a system has a serious issue and all other troubleshooting tips have been tried. Call your Service Provider before doing a firmware revert to make sure all other troubleshooting steps have been exhausted.

This restores the previous version FIRMWARE used on the system.

• From the Management Portal select SYSTEM → RESET → FIRMWARE REVERT. Confirm by selecting YES, FIRMWARE REVERT. The TU will reboot into the previous firmware version.

If the unit will not boot to access the Management Portal, a Firmware Revert can be accomplished by following these steps:

- Power down the system.
- Remove the SIM card cover exposing the reset hole. Using a straightened paperclip, insert it into the round hole just to left of the SIM card as shown in *Figure 6-3*.
- Push straight in **gently** until the paperclip causes the switch to click. At the same time turn the unit ON by pressing the power button. Hold the paperclip in until the LEDs blink and then release.

### Alerts

Table 6-2 Alerts / Error Messages

Alert Name	Description	Level	Additional Information	<b>Corrective Action</b>
ANT_CABLE	Cable loss excessive; check system; performance maybe degraded.	Critical	Cable loss may exceed the system spec of 10 dB	Check Antenna cable for damage or loose connections. Replace if necessary.
ANT_MISSING	Unable to detect antenna	Fault		Check Antenna for damage. Check for loose connections. Remove and reinstall the antenna. If problem continues, the antenna may need to be replaced.
ANTENNA_POST_FAIL URE	The antenna has failed POWER ON SELF TEST	Fault		Check Antenna for damage. Check for loose connections. Remove and reinstall the antenna. If problem continues, the antenna may need to be replaced.
ANT_WRONG_VER	The antenna is running incorrect version	Warning		Restart TU. Contact representative if problem persists.
APPROACHING_MAX_T EMP	System approaching maximum internal temperature - the terminal may reboot.	Critical	A system component may exceed the maximum internal temperature of 85 C. The terminal may automatically shut off.	Move TU to a cooler area or allow to cool down prior to further operations.
BCX-denial	Failed to connect to pass data, reason – location	Fault		Restart TU. Contact representative if problem

Alert Name	Description	Level	Additional Information	<b>Corrective Action</b>
				persists for more than 4 hours.
BCX_IBIT_FAILURE	The BCX has failed "Initiated Built In Self-Test" View Logs for details.	Fault		Open http://portal.thaleslink (or https://portal.thaleslink)
				and review Self-Test logs. Restart the TU. If problem persists, contact representative.
BCX_SIM	Modem failed to read SIM card	Fault		Remove, clean and re- insert SIM. Contact service provider if problem persists.
BCX_WRONG_VER	The modem is running an incorrect version.	Warning	The modem is running an outdated software version. The system will still function.	Restart TU and contact representative if problem persists.
DATA_WARN	The data cap has been reached.	Warning	The user specified data cap has been reached. Data will continue to pass.	Reset data cap, or wait until Reset Day.
MODEM_ACT	Modem returned an unknown error – cannot activate	Fault		Restart TU. Contact representative if problem persists.
MUX_PLL_UNLOCKED	Antenna mux out-of-lock with the modem.	Critical	PLL failed to acquire	Restart TU. Contact representative if problem persists.
PWR_IBIT_FAILURE	The power has failed "Initiated Built In Self-Test" View Logs for details.	Fault		Open <u>http://portal.thaleslink</u> (or <u>https://portal.thaleslink</u> ) and review Self-Test logs. Contact representative.

Alert Name	Description	Level	Additional Information	Corrective Action
PWR_POST_FAILURE	The power has failed "Power On Self-Test". View logs for details.	Fault		Open http://portal.thaleslink (or https://portal.thaleslink)an d review Self-Test Logs. Contact representative.
SIM_MISSING	SIM card not detected	Fault	SIM Card is physically missing	Insert or replace SIM card
TIME_INVALID	The system time is not properly set.	Warning		Open http://portal.thalesli nk (or https://portal.thalesl ink) and Synchronize Time on the Settings: GNSS page. Restart the TU.
VOIP_FAULT	The core node reports a fault.	Fault	The system may still operation.	Restart TU. Contact representative if problem persists.
VOIP_OFF	Core node is powered off, restart required	Defective	Core Node is noticed to be unexpectedly off.	Restart TU. Contact representative if problem persists.
VOIP_REBOOT	Core Node Reboot has occurred, full system restart is required.	Warning	Core Node Module restarts while the system is up and running.	Restart TU. Contact representative if problem persists.

	Weight	7.5 lbs. (3.4 kg)	7.5 lbs. (3.4 kg)

Table 7-3 Physical Characteristics

### **CONNECTOR DETAILS**

#### **General Purpose Inputs / Outputs (GPIO)**

Refer to Figure 7-2 for the connector and its pinout. The connector is located on the back of the TU and is labeled I/O. The GPIO has 4 main functions. Some of the functions are reserved for this connector are not yet implemented (they are reserved for future use.) Refer to Table 7-2 for the pin descriptions of the GPIO connector.

1. 1-Wire Emergency→ This is activated when Pin 5 has been connected to GND signal (ANY of the pins, 1, 8, or 12) for more than 3 seconds.

Once set, it sends an automated message stating Emergency has been triggered. This message contains Latitude, Longitude, Altitude and predefined user message (setup in Management Portal) to a message recipient.

If Location Services are turned, it will increase frequency of transmission to every 10 seconds.

#### NOTE: THERE IS NO LOCAL INDICATION OF AN EMERGENCY MESSAGE BEING SENT

This security feature is for user protection. The ONLY way to remove an active emergency message is to enter Management Portal under EMERGENCY TAB

2. Radio Gateway → Advanced users can connect Land Mobile Radio I/O to send and receive voice and Push-To-Talk (PTT) calls over the MissionLINK. This feature is for advanced users familiar with Land Mobile Radio systems and requires a custom cable connection between the GPIO connector (DB-15) and the target Radio (cables not offered by TDSI). Because each radio system will require a unique setup, it is highly recommended that you contact your TDSI representative for help in setup of this advanced user feature. See pinout (Figure 7-2) for creating the custom Radio Gateway cable. Refer to Table 4-10 for settings related to the Radio Gateway.

Figure 7-1 Radio Gateway for Advanced Land Mobile Services

3. 2- Wire RS232  $\rightarrow$  Reserved for future use.

Contact your service provider or Thales Customer Service for help in setting up of this advanced user feature.

 User defined GPIO→ Reserved for future use. Contact your service provider or Thales Customer Service for help in setting up of this advanced user feature.

#### **Connector Location**

The DB-15 connector with Pin out shown in Figure 7-2.

Figure 7-2 GPIO Connector Pin Detail

Pin No	Name	Description
1	GND1	Ground
2	Audio_In +	Radio Gateway functionality, differential (+) Hi-Z Audio Input from
		external Radio
3	Audio_Out +	Radio Gateway functionality, Differential (+) Low-Z Audio Output
		to external radio (mic input)
4	RadioCOR	Radio Gateway functionality, Radio initiated voice into terminal
		(optional)
5	EMER_IN	Emergency remote functionality, Ground pin to activate internal
		Emergency
6	GPI01	Software configurable GPIO pin #1
7	RS232_TD	RS232 Output (future)
8	GND2	Ground
9	Audio_In -	Radio Gateway functionality, differential (-) Hi-Z Audio Input from
		external Radio
10	Audio_Out -	Radio Gateway functionality, Differential (-) Low-Z Audio Output
		to external radio (mic input)
11	RadioPTT	Radio Gateway functionality, Output PTT from terminal to external
		radio, short to ground for PTT enabled, Open drain requires external
		10k pullup resistor
12	GND3	Ground
13	GPI02	Software configurable GPIO pin #2
14	RS232_RD	RS232 Input (future)
15	12V	+12V output, 100mA

VLAN	Virtual Local Area Network	
VoIP	Voice of Internet Protocol	
WAN	Wide Area Network	
Wi-Fi	Wireless Network	
WPA2-PSK	Wi-Fi Protected Access 2 – Pre-Shared Key	

Table 8-2 List of Definitions

Acronym	Description		
API	Application Programming Interface	The Management Portal provides API to allow for the connection to the terminal remotely.	
BAA	Broadband Active Antenna	The antenna and supporting electronics that interface an Iridium satellite terminal with the Iridium constellation	
BAE	Broadband Application Electronics	Hardware and software platform resident in the TU that interfaces with the BCX, BAA and user devices	
BCX	Broadband Core Transceiver	Hardware designed for an Iridium satellite terminal to interface end-user equipment with an Iridium BAA	
BIT	Built In Test	Diagnostic testing for system integrity check and error reporting	
DHCP	Dynamic Host Configuration Protocol	The Dynamic Host Configuration Protocol (DHCP) is a system used in computer networking to automatically assign networking information to a client.	
DTMF	Dual Tone Multi- Frequency	Signals generated from phone keypad	
EBB	Enhanced Broadband	EBB Mode is Iridium NEXT phase 1 EBBS (Enhanced Broadband Service)	

Acronym		Description
ETSI	European Telecommunications Standards Institute	Organization that maintains standards for Information and Communications applicable to fixed and mobile radio platforms
GPIO	General Purpose Inputs/Outputs	General use pins
HGA	High Gain Antenna	External antenna that connects to the TU via a coaxial cable. The HGA2 (also called BAA-H2) provides 352 kbps uplink and 704 kbps downlink capability
HRLP	High Speed Radio Link Protocol	Management of In-band signaling on broadband channels
HTTP	Hypertext Transfer Protocol	Protocol to exchange or transfer hypertext
HTTPS	Hypertext Transfer Protocol Secure	HTTPS is an extension of the Hypertext Transfer Protocol (HTTP). It is used for secure communication over a computer network, and is widely used on the Internet.
ICMP	Internet Control Message Protocol	Protocol by network devices that typically send error messages and is used for diagnostics
ITU	International Telecommunications Union	Agency of the United Nations responsible for issues concerning information and communications technologies
LED	Light Emitting Diode	Semiconductor that emits colored light
LGA	Low Gain Antenna	External antenna that connects to the TU via a coaxial cable. The LGA supports the Certus <sup>™</sup> 100 and Certus <sup>™</sup> 200 capabilities
Management Portal		Management Portal: A web page served from the Terminal Unit that brings together the diverse status and configuration information of the TU in one place.
МО	Mobile Originated	Calls originating from the terminal
MT	Mobile Terminated	Calls terminating at the terminal
NAS	Network Attached Storage	Ability to store and retrieve files to/from a physical memory storage device attached to the network
PBX	Private Branch Exchange	Telephone connection between local users not requiring external phone connection
POST	Power On Self-Test	BIT Test performed at the turn-on of the TU
POTS	Plain Old Telephone Service	A voice-grade telephone service that utilizes analog signal transmission over copper loops
PSTN	Public Switched Telephone Network	The world's collection of interconnected voice- orientable public telephone networks, both commercial and government owned.
PTT	Push To Talk	Two way radio term indicating the pressing of a button to initiate transmit before speaking
R/W	Read / Write	Read / Write Capability
RGW	Radio Gateway	Radio Gateway feature enables communication between telephone users and users of ground radios.
SIM	Subscriber Identification Module	Iridium provided method to authenticate and identify subscriber
SIP	Session Initiation Protocol	An Internet Engineering Task Force (IETF) standard protocol for initiating an interactive user session that

Acronym	Description		
		involves multimedia elements such as video, voice, and chat	
SMBus	System Management Bus	Two-wire bus for communications between devices such as a Terminal and a Smart Battery	
SV	Satellite Vehicle	Iridium Satellite	
ТСР	Transmission Control Protocol	Core internet protocol that provides reliable delivery and error-checking	
TLS	Transport Layer Security	TLS is on the standard way that computers on the internet transmit information over an encrypted channel.	
TU	Terminal Unit	Electronic equipment that contains the BCX and the BAE	
UDP	User Datagram Protocol	Connectionless transmission model with minimum , no- handshaking protocol	
UL/DL	Uplink/Downlink	To and from satellite communications	
VLAN	Virtual Local Area Network	For context within this document, VLAN more specifically designates an Ethernet VLAN. A VLAN is establishes a broadcast domain that is partitioned	
WPA2-PSK	Wi-Fi Protected Access 2 – Pre-Shared Key	Method of securing a Wi-Fi network	

### CHAPTER 9 KIT CONTENTS AND ACCESSORIES

#### MISSIONLINK KIT CONTENTS AND ACCESSORIES

The following tables list the kits available for purchase and their contents as well as accessories and spare parts that can be purchased separately.

Part Number		rt Number	Description
MF350BV			Standard Kit, MissionLINK® Certus 350**
	Qty	Part Number	Description
✓	1	1100789-501	Kit, Terminal Unit, Mounting Hardware
✓	1	1100790-501	Kit, Antenna Magnetic Mounts
✓	1	1100792-501	Kit, Antenna Mounting Hardware
✓	1	1600899-1	Broadband Active Antenna (BAA), Certus 350
✓	1	3402174-1	Quick Start Guide (QSG) MissionLINK <sup>®</sup>
✓	1	3900011-1	Mounting Template, Terminal Unit
✓	1	3900013-1	Mounting Template, BAA
✓	1	4102947-512	Terminal Unit, MissionLINK <sup>®</sup>
✓	1	855021-010	RF Cable, 10 ft LMR240
✓	1	855024-003	Cable, Vehicle DC Power Harness, 3 ft.
✓	1	855026-010	Cable, RJ-45 Ethernet, 10 ft.
✓	1	85728-001	Wi-Fi Antenna, 2.4 GHz Dipole 2 dBi

Table 9-1 Standard Kit, MissionLINK Certus 350, List of Equipment

\*\* The MF350BV is capable of up to 352 kbps uplink and 704 kbps downlink speeds.

**Note:** The SIM card is provided by the airtime service provider and may be packaged separately from this kit.

Part Number		rt Number	Description
MF350BV-1			Base Kit, MissionLINK <sup>®</sup> Certus 350
